As an enterprise-ready product, the development, maintenance and support of AutoCAD is handled by the AutoCAD Enterprise Services division of Autodesk. The Autodesk sales and support organization and Autodesk services team also support other products in the Autodesk family. Autodesk also offers a small business edition of AutoCAD as an alternative to the larger enterprise-ready product. History AutoCAD originally ran on the Atari 8-bit family of microcomputers, which was released in 1983 and used a Motorola 68000 microprocessor. A version of AutoCAD for the Apple Macintosh was released in 1984, and a Windows version in 1986. As microcomputers began to be replaced by desktop computers with built-in graphics, the development of AutoCAD had to be re-examined, and by 1990 AutoCAD had shifted to a client/server model where the AutoCAD program is installed on the client computer and the AutoCAD database resides on a server computer. This has remained the primary model of AutoCAD development until the current model of desktop/laptop/tablet/phone was introduced in 2011. AutoCAD History In the late 1960s, the National Center for Atmospheric Research (NCAR) began research into computer-aided design of complex physical systems. The first CAD program was conceived as a set of custom data files and a set of specially written menu commands, designed by J. Cleaver Smith and John L. Otto, for use with NCAR's TOPO-3 system. NCAR engineers continued development of CAD in the 1980s, and this version was released in 1984 as a desktop app on the Atari 8-bit family of microcomputers. This initial product was called Digital Designer. The NCAR CAD team had a very open approach to developing the product. As a result, there were multiple versions of the CAD software. NCAR's main objective was to make the software completely free, so anyone could use it without paying a license fee. At the time, the NCAR team was working on the development of microcomputer graphics for CAD. They were able to port their existing CAD routines to the new microcomputer graphics hardware. The NCAR team also recognized the need to do some work on the software to make it more user-friendly. The NCAR team developed an interface with a graphical user interface (GUI) that would facilitate easier use of

Customization Because of the dynamic nature of the ObjectARX library, it is more flexible than previous tools. Customization allows customization of forms in AutoCAD. It is composed of a series of "forms" and "commands." Commands Commands are used to perform functions in an application. A command may perform several functions, depending on the context in which it is used. AutoCAD commands are accessible to all AutoCAD users (there is no need for any special rights). Forms Forms are specialized areas within an application. Depending on the application, a form may be used for configuration, input or output. A form consists of a set of commands or functions. Forms can be used by all AutoCAD users. Access controls Access controls allow users to limit access to only particular users. Customizers Customizers allow users to add their own commands and customize the form. Customizers are available on all AutoCAD forms and may be added from various places. Customizers are designed to let users override all of the basic commands so that they can create their own forms with the customized functionality they need. Visual LISP Visual LISP is a kind of Lisp program. Concepts and elements AutoCAD's object modeling and drawing system is based on a programming language. An object is a model element that is defined using attributes and procedures. Object types are built using a set of classes. Each class has its own set of properties and methods. The user can define the object attributes and methods using "commands" (actions). The commands are a powerful language that allows the user to add, modify and remove properties. Object model commands (OMC) enable the user to access the object's properties and methods from command buttons and dialog boxes. In general, an object may have many properties. These may be specific to the type of object, or may be shared by all objects of the same type. Properties may be modified using either AutoCAD commands, or using Visual LISP. Objects and classes The object model is built on classes and properties. The classes are used to define the type of the object, and may include data and procedures, which are referred to as "members." The properties are shared among all objects of the same type. A class consists of its properties, which are accessed using the GetProperty() and SetProperty() functions. Members (procedures and variables) 5b5f913d15
